

Sales Proposal AI Agent (Copilot-Style Enterprise Workflow)

Internship Submission – AI Agent Development

By : Mohit Sunil Haibatpure

The Problem with Sales Proposal Creation

- Proposal drafting is repetitive, time-consuming, and prone to errors, significantly impacting productivity.
- Critical context remains fragmented across various systems including CRM, documents, emails, and chat platforms, leading to information silos.
- Multiple internal stakeholders must meticulously align and approve content before external sharing, slowing down the sales cycle.
- Existing tools are primarily designed to optimise document creation, rather than streamlining the entire workflow process.

Proposal creation is a **workflow problem**, not solely a writing problem.

Why an Agent-Based Approach

Why prompts / copilots are insufficient:

- Stateless and reactive, lacking persistent memory or ongoing context.
- No memory or continuity across interactions or time.
- Cannot coordinate complex, multi-step workflows effectively.

Why an agent works:

- Maintains critical context and state across multiple sessions.
- Actively manages the entire proposal lifecycle from inception to completion.
- Capable of acting and integrating across diverse systems, not just generating text.

This intricate problem cannot be effectively solved with a single prompt or isolated conversational interface.

What the Agent Owns vs What Humans Own

Agent Responsibilities:

- Gathers relevant enterprise context from CRM and historical proposals.
- Drafts structured proposals based on defined templates and collected data.
- Maintains memory and context across interactions and over time.
- Simulates internal approval workflows, flagging potential issues.
- Generates exportable artifacts, such as professional PDF documents.

Human Responsibilities:

- Provides the initial intent, specific requirements, and critical constraints.
- Reviews and finalises the generated content, ensuring accuracy and tone.
- Handles external sharing, client negotiation, and strategic decision-making.

The guiding principle: Clear boundaries ensure the agent remains reliable, trustworthy, and supportive.

Proposal Lifecycle Orchestrated by the Agent

- Each sales proposal, alongside its complete context, is meticulously persisted per client, ensuring a comprehensive record.
- Historical proposals and associated interactions are fully retrievable on demand, providing a rich dataset for future engagements.
- Agent memory is rigorously scoped, auditable, and deterministic, ensuring consistent and predictable behaviour.
- This approach eliminates the need for constant model retraining or repetitive prompt replay for historical context.

- Each sales proposal, alongside its complete context, is meticulously persisted per client, ensuring a comprehensive record.
- Historical proposals and associated interactions are fully retrievable on demand, providing a rich dataset for future engagements.
- Agent memory is rigorously scoped, auditable, and deterministic, ensuring consistent and predictable behaviour.
- This approach eliminates the need for constant model retraining or repetitive prompt replay for historical context.

Enterprise Safety & Trust Considerations

Data Leakage Prevention

Strict controls are in place to prevent any cross-client data leakage, safeguarding sensitive information.

Access Boundaries

Explicit data access boundaries are enforced, ensuring information is only accessible to authorised personnel.

Deterministic Fallback

The system is designed with deterministic fallback behaviours, guaranteeing predictable responses even in unexpected scenarios.

Human-in-the-Loop

A human-in-the-loop approval model ensures oversight and final human authority over critical decisions and outputs.

The core principle: The agent acts as an invaluable assistant; it never overrides human authority or critical judgment.

Design Trade-offs & Future Scope

Current Trade-offs:

- Utilises mock CRM and approval systems for demonstration purposes.
- The user interface is currently at a prototype level, focusing on core functionality.
- Integrations with enterprise systems are simulated, not live, for initial development.

Future Extensions:

- Seamless integration with Microsoft 365 Copilot for enhanced productivity.
- Leveraging Azure OpenAI for advanced drafting capabilities and content generation.
- Implementing real-time connectors for CRM and document management systems.
- Facilitating multi-agent collaboration for more complex, distributed workflows.

This project embraces an honest, pragmatic, and forward-looking approach to development, acknowledging current limitations while planning for robust future enhancements.

Live Demo & Resources

- Live demo URL: <https://sales-proposal-ai-agent-g7jr47rkdxqegfcpxez9b.streamlit.app/>
- Backend API: <https://sales-proposal-ai-agent-backend.onrender.com/docs>
- GitHub repository link: <https://github.com/MohitHaibatpure/sales-proposal-ai-agent.git>
- Key demo actions to highlight:
 - Executing the agent workflow from client input to proposal generation.
 - Viewing and interacting with the agent's persistent memory.
 - Exporting the final proposal as a professional PDF document.

This prototype compellingly demonstrates how agentic systems can operate across diverse workflows, manage complex context, and reason effectively across time – moving beyond mere text generation.
